After a long development break, new versions of the basic packages for the Unix environment "AmiCynix" were released. In the main, bugs have been fixed which prevented the proper function of the X server on new Amiga systems.

New in AmiCynix-Base:

- * All display drivers and the X server binary were revised to fix the following problems:
 - With newer graphics cards like the Radeon HD 7xxx the colours of the display were wrong. Fixed with the standard drivers and the rest for the most part.
 - Since AmigaOS 4.1 final Update 1 it came to program crashes, if the graphic driver picasso96clonewbdb was used. Is fixed now.
- * The display driver picasso96clonewbdb can now also open 32 bit screens internally, however, the data is still processed in 16 bits.
- * The print command "lpr" now supports the printout via Turboprint whereby the print quality is increased.
- * Updated SSL support over OpenSSL and GnuTLS. The included Trusted Certificates have been updated.
- * Many more improvements and bug fixes.

New in AmiCynix-Tools:

- * The browser NetSurf has been relinked with OpenSSI 1.01o. Many SSL keyed pages could not be opened anymore. The problem is now largely eliminated.
- * Current versions of the image viewer GPicView and the GTK+ 2.0 toolkit adjuster LXAppearance.
