Alt key: I remember there being some issue with that. Can you use left alt, or is it alt altogether, that's a problem? I think they give different input in AmigaOS.

Protection bits: Well, as far as I recall, there is not a lot of room for controlling file parameters in Qt. I could be wrong, let me check... EDIT: I can set file permissions, don't know, if those takes care of all amigaos protection bits. But this is additional coding! Up until now, I have just changed as little as possible in JuffEd's sources. What you are asking for is an additional feature, not a bug. EDIT: There is no way to control the script bit. Only read/write access for user/group/admin/other and executable bit.
