@Capehill

```
Adding of size_t channelNameLen = (msg->Channel) ? strlen(msg->Channel->c_Name) : 0;
```

and then you can use the result as an AllocVec parameter, kind of work, but the same as it work when i just do "AllocVec(200, MEMF\_ANY);" , but then later again crashes come because of channel.

Something going wrong and trash channels, and that later lead to problems not only in that function, but elsewhere.

I may add to the wookie repo my changes to make it all compiles, so everyone may try to fix it.
