I commit necessary changes to wookie repo:

<https://sourceforge.net/p/wookiechat/code/HEAD/tree/>

So now everyone can download it , and just run "make -f Makefile.aos4" to have aos4 build.

Through, you may have problems with building catalogs via flexcat (as have i on cross-compiler), but probably on real os4 it will works as it. If not, you may need to edit .CD file a bit to remove some "bad" characters. Also to avoid problems with build another catalogs, you may just remove from makefile all catalogs generation except english (at least for tests, until wookie didn't work as should).
