Where is libharfbuzz.so?

Open a shell, cd to sys:sobjjs and enter:

```
makelink libharfbuzz.so libharfbuzz.so.0.9.28
```

OK, now it says it cannot find "libxml2.do.11" (I can only see .9). Any hints?  
edit: I found the required file buried inside [here](#), which is ridiculous.

And what is to blame for all these broken SObj stuff, SMTube or the latest QT?
