The find field in the GUI only filters the currently downloaded results set. There is a limit on the number and frequency of requests, so frequently polling by keyword is not viable, also I wanted to keep the GUI simple

So:

Quote:

My use case may be obscure, so I do not necessarily expect anything to be done about this (I just report it & let you decide whether it's worth doing or not).

That's why I added an ARexx interface, and extended the API to add StationSearch

```
rx "ADDRESS TUNENET.1 STATIONSCAN STATIONS 500 KEYWORD 'J-Pop'"
```

Gives ten results here, number of results may depend on number of station currently broadcasting as the results have changed from 8 to 9 10 and back again whilst I was verifying.

NB: You get more results for JPOP than J-Pop
