I haven't tried yet using --target option.

Btw, as i said in a previous post, one installation of the UWin environment worked fine. I used this installation to configure the SDL R188 and the configure report was OK. As for the math, for example, the summary reported no assembly math, just as i had specified using the flag --disable-altivec. The compilation of the SDL2 started OK, until the compiler hit the Amiga SDK requirements (i used the version 53.24).

I've been told that --host isn't guaranteed to do what you want (as in, has been known to choose the wrong compiler).

Regardless, trying out --target can't take more than a few minutes. So just try it, and see if it works. The same goes for the other instructions I linked to.
