I'll need something a little more specific than that :) Does it work with the one on OS4Depot? Usually that would be the one with the bug. If you have any shell output that'd be appreciated. I'll check back later, in the meantime, zzzZZzzzz.

P.S Try with -vo comp or -vo sdl. Still, shell output if you can grab it. Might be useful to delete/rename the config file or remove quiet=1 from it.
