Yeah it looks like some crash in curl. You could look through the YT-Debug.log file and try to re-run curl with most of the same arguments, but maybe take the s out of -Lkso. Dwarf stuff I've only seen when kas1e informed me about some problems he had when mixing libraries built with different gcc versions (but that issue was sorted out for him). curl itself is a statically linked binary that's tested before being put on OS4Depot, so it should be fine.

I did notice a double-slash in that path name, but it's probably just a quirk of gdb.

I have the same question as broadblues. Did the GrimReaper window open first? If you were typing away at the time, it may have only briefly flashed on the screen. If so, looking through the YT-Debug.log file to see what the full command line arguments were for curl, will help.

When you say "video search function", I'm not 100% sure what you mean. YT.rexx will detect a non-YouTube site and scan the webpage for links to YouTube videos. When it does that it will be running curl many times (not simultaneously though). Perhaps there's some issue when it's ran over and over again in quick succession. Out of curiosity, how many megabytes of memory are you using in WinUAE? Are you using the 64bit or 32bit version of WinUAE?
