With Sam440/M9 the numbers are like 1000 FPS for single-buffer and 60 FPS for double-buffer, it's in VSYNC. It uses an OS-supported double-buffering mechanism ( [https://github.com/AmigaPorts/SDL/blob ... os4/SDL\\_os4surface.c#L617](https://github.com/AmigaPorts/SDL/blob...os4/SDL_os4surface.c#L617) ). Your 116 FPS sounds odd in many ways.

Perhaps the thing you are seeing is a some kind of tearing artefact? Is VSYNC working on X5000 in general?
