If anyone in interest, i grab the latest version of euae-jit from there :

<https://sourceforge.net/p/euaeppcjit/code-0/HEAD/tree/> , revision 161

As well as build latest version of SDL1 from

<https://github.com/AmigaPorts/SDL/tree/SDL-1.2> , version from 2018_11_07, without debug, of course.

Then build SDL version of euaeppcjit against it, with -O3 optimisation, all over gcc 8.2.0, newlib. Had to fix few little cosmetic issues with includes/etc, no code changes of course.

There is if anyone need it:

http://kas1e.mikendezign.com/aos4/uae..._ppcjit_2018_11_24_v3.zip

I can say that at least that bug with "gfx_vsync=true" when all staying black in fullscreen and i can't press "alt+ctrl+s" to switch to window, or "alt+ctrl+q" to quit, half fixed automatically by new sdl (or by new build in whole, dunno): now while it still same black screen when "gfx_vsync=true" is used, it at least didn't freezes everything, and you can "alt+ctrl+s" to switch to window mode.

Probably also because of up2date sdl (where Capehill do a lot of cleanup, fix bugs, update core of it to latest versions of 1.2.x) that uae thing will works more stable, but who know of course.
