URL:

Hi all,

I am getting corruption on a SSD partition on p5020sata.device which uses SFS2.

the error is :

```
findextentbnode: findbnode() can't find key 3697896!
```

```
error=0 *returned_bnode=6F665A9C (*returned_bnode) ->key=3697656
```

since I have valuable data in this partition, how do I fix this and why is it happening ? I never had this kind of error on my trusty AmigaOneXEG4 but I am regularly getting this error specially in Odyssey folder...
