@Lio

You always need two physical disks IMO. Wether permanently installed or a USB backup disk. Disks break down all the time, including SSD. You simply need backup.

Got a new PC at work with SSD. Worked great for 3 weeks, then crashed and never started again. Replaced the SSD and it has been running for 4 years.

I have setup BackUp using DRemind to backup all my partitions automatically and regularly. And just the other day my primary harddisk started to show signs of resignation. Good thing I have a mirror backup setup and ready to go 😊
