True, Odyssey can't do that, i was thinking of another browser, sorry for the mixup. (Though you can always put Odyssey on it's own partition and start it from a script, that way, if Odyssey was the culprit, it will crash only it's own data the next time it fails, which hopefully never comes)

I'm using a SFS2 formatted external HDD, which i attach through USB when doing backups. I do them by the quarter of a year and it saved me already many times.
