I found out it is incorrect. But I noticed two MUI applications didn't allow a wide window, AmigaShell did.

Yes indeed you can have a window that is wider thn the screen.

Quote:

When the shell window was overwide, moving it went super sluggish. That is with hardware compositing and about 90 MB VRAM available.

You probably increased the windows bitmaps width to wider than the limit for hardware compositing. (which varies from card to card) .
