It's probably 2048 (2k), but window bitmaps are a bit larger than the window size (allowing for shadows etc) so the practical limit for screen and window size is a bit less than that.

On my SAM with a R9250 card I can in principle just get a HD (1920x1080) screen (though I have a older 1280 sized monitor so don't try) so the practical limit is probably just a little more than 1920 thus only a small increase in window size from the HD screen width will hit that limit.
