I asked here for a new port mostly because in general i was unable to extract big archives from it, i though this was caused by the relative age of our version ... but maybe it was not ?

Adding large file support to unrar looks like it should not be very hard to do as the file i/o seems to be limited to only a couple of files.

Basically to support large files with newlib some functions need to be replaced, like fopen() => fopen64(), fseek() => fseek64(), stat() => stat64(), ... and some types like struct stat => struct stat64 and off_t => _off64_t.
