I assume you don't have AmigaOS already running, so RawDisk is of no use to you.

Yes, you can make a bootable CD/DVD/USB stick/any kind of volume.

Start by downloading/unpacking the ISO from Hyperion, then burn the ISO to a disk using Nero or similar. That's the easy one.

I've never done it, but it should be possible to dump it to a USB stick as well. Maybe there is a Windows expert around who can help you. But remember that you can't write it as a file using copy or drag 'n' drop. It has to be written as a complete disk volume.
