I tried to run Jedi in window mode, with very high textures settings (so to see memory monitor), and can say that it didn't fill the system memory when lockup happens.

It only come to just 700mb of system memory being in use, and then lockup. So its something else.

There is what i get on serial when lockup happens:

```
[HAL_DfltTrapHandler] *** Warning: Fatal exception in task 0x62C831F0 (openjk_sp, etask = 0xEFDE2F10)

I didn't test latest RCTW which works over gl4es and which have lockup too with high-texture , but will do, as it can be just the same , and if so, then it very possible can be something in drivers , as if it issues with 2 different games .. (through about the same engine, right ?)

Quote:

Do you plan to compile those games to use latest versions of GL2ES or GL4ES for AmigaOS 4, or even the Warp3D Nova? I don't know how much work needed, but I guess they will gain some speed and better graphics, based on the updated implementations.

If BSzili doesn't mind, i can try to build from his repo GL4ES versions of ArxLibertatis & Jedi , if the code in the repo up2date with all amigaos4 ifdefs and co.
