Found intersting bug-feature of iconification.

Problem is: if you have snapshot icon of sdl2 app not very close to the left border of wb window, then when you press iconify it will be placed not in the next free slot, but on some other place on workbench (place always different, depend where you snapshot in wb window your sdl2 app icon).

See what i mean :

That one allright , when i press iconification (and icon placed in the wb window as first one) it iconfies to next free slot:

http://kas1e.mikendezign.com/aos4/sdl2/iconify_icon_first.jpg

And that one, when i move icon in wb window to some other place , snapshot it (only then, its snapshooting which make it behave strange) and press iconify :

http://kas1e.mikendezign.com/aos4/sdl2/iconify_icon_not_first.jpg

See there icon placed to some other place.
