By 1) question I meant that if you snapshot when your icon is for example in (100, 100) coordinate, will the icon appear in (100, 100) position always after that, or some place?

I tried to test this by borrowing the Notepad icon. If I iconify the Notepad application itself, it will appear in the first free location. But if I iconify a testapp that uses Notepad's icon, it will iconify to the position that is stored in the icon. So the behaviour between Notepad and test application is different.

So if we want to ignore icon's position, I guess we have to modify the DiskObject somehow before calling AddAppIcon().
