Include the relevant `<proto/#?.h>` to get the extern definitions of the library base and interface globals.

Make sure that you don't define variables with the same name yourself (like billyfish does) and that you don't define `__NOLIBBASE__` or `__NOGLOBALIFACE__`.

If you follow the above then any use of the library interface like "ISomeLib->SomeFunc(blah)" should cause the relevant interface constructor to be used.

You also need to be using standard startup code for it to work.
