Yes, that's what I'm trying to do. My original goal was to just get a usable hostname for the local machine (which AmigaOS doesn't report correctly). However, ultimately I want to be able to identify all machines on the network.

Avast's Wifi Inspector is able to do that,\*\* so it's got to be possible.

Hans

\*\* Probably with the exception of machines in "stealth mode" that don't even respond to pings.
