Workbench Explorer v2.3 build 9400 has been released!

Use "Check Latest Version" from the menu, AmiUpdate, OS4Depot, or Aminet, to upgrade.

[2.3 build 9400] - 2019-5-13 5 Year Anniversary

Added

- Downloads from Aminet and OS4Depot now have the path set in the file note.
- Version column. On by default, disable in Preferences->Columns.
- Version is shown in search results if applicable.
- Preferences->Window->Toolbar image size.

For normal (24x24) or more compact (16x16) toolbar.

- Preferences->Operation->Use internal Information system.

Not using this will use the default program, usually RAWBInfo, to display information about the selected item. Not using WEx's internal Information will limit some extra useful data. Use Menu->Tools->Tool type editor to edit icon tooltypes.

- The version or picture details, if applicable, is shown in the paste exists box for each file. The "Get version" button still shows the complete version information.

Fixed

- Blank menu images now done internally.
- Cleaned up context menu alignments.
- Sort arrow was put on wrong listbrowser column when columns were re-arranged.
- Content view style was not showing the correct data.
- Changing drawers order was not refreshing.
- Improved sorting routines.
- Small bug in SAK_GetVersion().
- Rare bug when close Preferences dealing with using own screen or not.
- Bug that would crash WEx if the Preview pane is open and then open a new tab at Computer.

Changed

- The paste exists requesters are much smaller allowing for future expansion.
- The StatusBar now uses my InfoData.class.
