Try @`{amigaguide}`

The lower case seems to work. Maybe other uppercase commands in the autodoc need to actually be lower case too.

An example amigaguide I have uses `@{"Amiga" link amiga.brush/main}` to display an image on a separate page. The `amiga.brush` file is an IFF image file in the same directory as the example amigaguide. It doesn't work without the `/main` after the filename. I edited the command to link to a text file and that worked too.
