@Raziel

Not entirely sure what you're asking, but I'm using an SSD and 2 SATA drives in my X5000.

I installed the SSD on the p5020sata.device, and contains WB, Work (apps & documents), Games, Misc/Temp, OS-4 Depot (apps I'm not actively using) and Amicygnix (which I use for Amicygnix, QT, Odyssey and Timberwolf).

I also transplated 2 SATA drives from my A1-XE, onto a sil3112 pci card, which contain documents, videos and pictures.

More and more I am finding that I use my NAS for pictures and videos, as I transfer stuff between my Amiga, iPad and phone.

They perform very well. Initially had some problems with my SATA drives, but I traced that down to a loose cable connection.

Umm, surely moving data from an SSD to a SATA drive would not reduce wear but increase it? After all, an SSD has no moving parts but the SATA does? Or do you mean "wear" in a non-phyiscal sense?
