The "link" and "/main" did the trick, thanks a bunch, also it doesn't like " in it's path.
But there is no info whatsoever given about that "link" part and the "/main" part either. AutoDocs are outdated :-/

Actually no they are right, you and (and I at first) didn't read them correctly. It could certainly be clearer.

Quote:

@{<label> <command>}

Indicate a textual link point. Can be anywhere in a line.
Starting with 3.0, AmigaGuide can can link to graphics,
sounds, animations and other DataTypes.

Creates a link button in the document with the <label> as the displayed text. It executes <command> when clicked on.

command could be any of the REXX commands listed lower in the page.

eg

@{"Click me" BEEP} beeps the screen

@{"chapter two" LINK Chapter2} internal link to node chapter2

@{"external" LINK someother.guide/main} link to the main node in an external guide

@{"other" LINK someotherguide.txt/chapter3 } link to node chapter3 in an external guide

@{"crash me" QUIT} does what it says in both multiview and multiviewer :-/

et cetera et cetera....
