After my last post I discovered that I have the logfile datatype installed and that appears to be the problem. Also, if I load the USB log with Multiviewer then only one window of the log is displayed and there is no way to scroll down to the rest of the log file contents. However, Multiviewer displays it correctly and you can scroll down to see the entire log file. Since I can't find any documentation for a log file format that works with the logfile datatype, it seems fairly useless. Combine that with the aforementioned bugs and I think it would be wise just to remove it.

I was going to add a file pattern to the logfile datatype descriptor but there already is a file pattern in the descriptor. There is also a hook file in the descriptor which apparently overrides the file pattern.
