That strange .. dunno , maybe it related to which files is used exactly.. but then, that happens only from USB stick, and as i can see, not from all the places. I.e. , let's say in one directory i have some .txt file, which cause that. Then if i copy that file somewhere else one the same usb stick, then, not crash. But if i use it from original place, then crash is here..

Triing to understand what common there .. But sure there some bug somewhere..

EDIT: Omg ! IT happens even with Filler, just a bit differently. Interesting.. But that probabaly ruled out Dopus5 then.

With Filler it says:

Invalid object lock

Process: "WbRun"

Function: "UnLock()"

And then no DSI, just busy loop (which maybe crash as well, which flooding serial and cause that busy loop).

Probabaly it can be some issue with masstorage.device, or fat filesystem code, or so..
