Every program that wants to use extended memory needs to add specific support for it.

This is why it was obvious that almost no apps would be written supporting this feature (reserved for motivated and skilled developers) and also because almost all apps don't need large amounts of memory. I am glad to see that helped with SketchBlock but this feature should be entirely managed by the OS. Maybe one day ...

@Raziel

I recently looked for memory sticks for my X1000 but I didn't find 4 GB ones. So I thought that we could have 2 GB in each of the 4 slots, that is to say 8 GB max. Anyway, that's not necessary to buy 16 GB betting they will be addressed by OS4 soon.
