+1 for CSS, SQL, Javascript and JSON.

BTW, can a file be highlighted in more than one syntax? E.g. it is quite common to have files with HTML and embedded PHP (and even SQL inside that), or HTML and embedded JS.

I assume "Localization" means .cd and .ct files? If not, +1 for those too.

Incidentally, the MUI texteditor.mcc class was already converted to ReAction many years ago, IIRC, by Allan Odgaard himself for OS 3.5 or 3.9 (subsequently rewritten for OS4 by Stephan Rupprecht). That became the texteditor.gadget (on which, I think, the richeditor.gadget was subsequently based? **Edit: Not the case, see next post by Rigo.**)

Best regards,

Niels
