I used the aget tool from the uhctools archive <http://aminet.net/package/util/misc/UHCTools>

It's a http download tool that is not such a big bottleneck as odyssey and it calculates the average speed in a readable format so it's quite good.

The file i downloaded is a benchmark file provided by my isp.

My result at 11.23MB/s equals 89.84 Mbps so it's okay for me. But would be nice to know the max speed when not being limited by a router or the isp but i think it's fair to say that roadshow is up to the task to deliver decent speeds but all our tools might not be.

I do not have any real upload speeds to report now and it's been too long since the last upload to even guess but i'm sure it was way better than yours.

Is your nic connected by pci or pcie? pcie is supposed to be faster.

Have you checked the speed of the onboard nic with the driver provided by aeon?

I'm so happy with my 8169 nic so i have not bothered to try that new driver yet.

I have the beta updates so that might have some impact on my results.
