Tested latest, found some stuff in pausing of profiling.

I.e. that what i do:

- 1). run glsnoop as "glsnoop PROFILE GUI", then immediately press "finish".
- 2). run foobillard++, go to the place i don't like, press in glsnoop "start", doing things, and press "finish"

Now, i expect in the log just one profiling result as i didn't run any binary to check when press "finish", so it should be skipped imho, but there still was two profiling reports : and both for the foobillard ! Ok there can be 2 , first empty with nothing (as nothing was running), and second for foobillard++, but there was just 2 and both for foobillard++

First one probabaly should't be for anything and be empty (or even should't be recorded, as nothing was running).

Also, in that "2 times profile" report, i see in second one wrong FPS count at top of the ogles2 output, somethinge like frame/s 1500 which is impossible, as in reality its about 50 (but in first profile output, which happens when foobillard wasn't running, it was right, 50fps or something).

Also i have a freeze when exit glsnoop and/or app when playing with profiling start/finish, but that one i need to recheck, as pretty possible just bad luck.
