But I have now removed it.

Thanks ! Now all looks clean !

I do test it and just pure running "glsnoop GUI PROFILE", so all automaticaly saves. And just when i do press "finish" and "start" only one time, or few times, or one time at begining, and then few times in places i need : all fine.

I also tried it together with tracing enabled too: pause tracing, start/finish profiling, restrart tracing, in few different conditions : all seems works as expected.

Fat thumb up for 0.2 !

As final nitpicking , maybe also part in the Readme about "pausing" need to be changed a little ,i.e. now it reads as it was before when we have only one button pause, but now we can pause and tracing, and profiling, just different buttons, and while pause in tracing mean real pause, in profiling by pause (finish) mean that we send profiling information to serial.

But man, you go pretty far with it for sure. Thanks a bunch !
