I've been using sgit on my X1000 now, and I can confirm that the slowdowns with "add" and "status" are a problem even on fast machines. The bigger the repository, the longer you have to wait.

I have a project with over 300 MB of data,** including the build directory which sgit should ignore, and sgit add . can take over a minute.

Does sgit do a full diff of everything all the time, including files that haven't been modified?

Hans

** NOTE: The size of the actual source is much smaller.
