Found some issue with makefile.amigaos4 which you may want to change:

1). CFLAGS = -ggdb -O2 -Wall

So it should be for first -gstabs for debug build, and for second, it shouldn't be in CFLAGS, or it always is, even with release mode, which makes library be much fatter.

2). -gstabs should be added only when we build debug mode

In other words right block at top of makefile should be like this:

```
SHELL = /bin/sh
CC = ppc-amigaos-gcc
INCLUDE = -I./include
CFLAGS = -O2 -Wall
LDFLAGS =
AR = ppc-amigaos-ar
RANLIB = ppc-amigaos-ranlib
PIC_CFLAGS = -fPIC -DPIC
#DEBUG_CFLAGS = -gstabs -DDEBUG
DEBUG_CFLAGS =
```

I.e. when one wants debug build, he uncomments that string, and has debug output from sdl, and -gstabs for stack traces, etc. And when one wants release mode, then it builds without everything to speed things up and to remove debug altogether.

With that, we have just 500kb of size of static libSDL.a in release mode, instead of almost 4mb in debug mode.
