ScummVM: DebugPrintF was not declared in this scope

edit1: sigh...not to self...#include<inline4/exec.h>

edit2: This comes up on serial when i start the launcher, nothing comes up, apart from the crashlog, when starting a game

Quote:

DOS: 1875689840

Minimum lib version:52.20

Does that help?

ResidualVM: i have absolutely no idea how i could read out the used formats, its unfortunately not as easy as in scummvm.

The only stuff i was able to read out is a long number 1308... etc, but i hvae no idea what to make of it, neither do i know if that is the correct thing to debug.
