URL:

I use winuae to use amigaos 4.1 FE etc.

For this I use the software available on osdepot

My question is this, what is used with amigaos 4.1 to compile a program from a possible source

cpp, gcc, gcc-c ++, gcc-gfortran, autoconf, automake, make, bison, binutils, flex, patch, tcl, tk, etc ...

What can I use in this case with amigaos 4.1 FE to compile the sources?

Thank you for any replies and suggestions.
