Well, I'm glad you solved it.

it would be interesting to know what you can experience later.

FlowerPot is a great installer for 4.1 to have a ready base.

It would be interesting to add many other things to have a system with all applications ready for use at Flowerpot

I don't have the "capabilities" and unfortunately little time to create a complete installer.

I'm facing a big battle with my wife because of her health.

And I've decided that life is more important than anything else and even one's profession.

All this helps me not to think and distract myself many times.

And that's good for me it helps me a lot.

Well I hope you can enjoy the emulation of 4.1

For other information you can see the videos if you feel like it, FlowerPot could be expanded the author has all the abilities to do it.

And it would be a nice idea (I think)

However my experience on 4.1 is based only on emulation, even if everything seems to work.

In the EAB guide linked above you will find many things.

Besides, surely here there are expert people who can help you better than I could do it. 😊
