\*I\* am still using FFS and I don't plan to switch to JXFS yet. Two main things are preventing me to do so :

- 1) no proper (and trusty) tool(s) to recover/repair damaged JXFS partition,
- 2) not bootable.

I wasn't aware of the protection bit problem but that is certainly annoying.

FFS does the job for me, not speedy but it works, since I use it on my A590 (arround 1990) I never had any problem unrecoverable that was not due to me, for example I still have files on my current HD that are dated from this period.

EDIT: another advantage about using slow file system : you think more before launching a complete compilation because you know it will take time, so you tend to write better things 😊
