There is no maximum partition size (unless there is a bug), that is why JXFS exists. SFS/0 has a maximum partition size of about 120GB, SFS/2 fixed that but perhaps the fix was not a good fix which is why JXFS was born.

Maybe, as you say, WD disks have a problem or are different somehow, but I kind of doubt that too.

I've had a couple of WD Caviar disks and they have all worked fine. This disk is a 160GB Maxtor.

Perhaps its buffers got trashed when I first filled up the disk, or perhaps it's simply dying? 😞
