One question: Did you make your JXFS partition bootable?

In that case OS4 (not U-Boot) might try to boot it everytime you try to add it, but it's empty so you get Please insert ENV:.

OS4 can most likely boot JXFS, but U-Boot cannot load kickstart modules from JXFS. This might get confusing since it has happened many time for me that U-Boots boots another partition than OS4 does!

For example, UBoot may load kickstart modules from somewhere, but OS4 say no bootable disk found and puts up that purple insert disk screen.
