### Final Update...

I changed the size of my 2nd JXFS partition by deleting it and adding it again leaving some room at the end of the hard drive for a smaller partition.

I added another small FFS partition at the end of the drive ... seemed ok until I did a cold boot.

Please insert volume

ENV:

in any drive.

I booted up the system using my CD and changed this last partition to SmartFilesystem (SFS\00) and the system boots just fine from hard drive.

In summary ...

My system will not boot from hard drive with 2 FFS partitions and 2 JXFS partitions.

SWAP

DH0 = FFS = main OS4.1 system partition approx 2 GB

DH1 = JXFS = miscellaneous stuff approx 35 GB

DH2 = JXFS = some more stuff approx 190 GB

DH3 = FFS of any size

My system boots just fine with the following mixture, with no complaints whatsoever:

SWAP

DH0 = FFS = main OS4.1 system partition approx 2 GB

DH1 = JXFS = miscellaneous stuff approx 35 GB

DH2 = JXFS = some more stuff approx 190 GB

DH3 = SmartFilesystem (SFS\00) of 2.8 GB
