The new USB functionality works great on my sam440ep 😊

Following devices works fine:

- Hewlett Packard 1100 PhotoSmart (printer) *

I'm having problems with usbprinter.device. If my printer is turned off when I start a program that accesses printer.device to get the printer configuration, I get AmigaDOS requesters & little USB messages on a small white background complaining that there is a failed device access (USB can't find printer). This is really bad when starting PageStream. I get a half dozen requesters on WorkBench and a half dozen USB messages on the PageStream screen. The screens flip back and forth as I cancel the requesters. Have you experienced this problem with your printer & programs like PageStream or FinalWriter? It didn't happen before I installed the update.
