I'm using Tunenet every day. First i wan't to thank you for the first and very stable version of Tunenet delivered with Amiga OS4.1 Update1, known as Tunenet Version 0.92.44.

No problem. Glad you like it.

Quote:

Songend recognition for Modules, TFMX, SID-Files (its really annoying to press "next track" if the song repeats over and over again with correct repeat-settings)

That is really down to the plugin, a plugin can signal a tune end to TuneNet at any time. I remember providing a bit of code to Curty for use in the SID plugin to detect end silence, but that of course is not enough for certain SID's.

Quote:

- Save of the Mixer-Settings for every Plugin-Type (all Modules require for example a +18 Stereomix to be enjoyable with headphones and for tfmx-modules of course 150% Volume-Boost)

- Autoplayback Playlist/last played Song after restart Tunenet

The Autoplayback will definately get implemented at some point, I'll make a note of the mixer settings.

I found a small bug in the 0.92.44 version. When playing a shoutcast station, the song info in ENV:TuneNet is only saved once for the first song. Any song info played after that never get written to ENV:.

OK, I'll look into it and get that sorted. I think I know what the problem is.

I have a new version of TuneNet which I'll release as soon at the experimental MP3Cast plugin gets the thumbs up (in the other thread).

Cheers,
Bean.
