OS4.1 Update 1 had a life span of one week here and I went backwards, gak. Why? I use SDLBasic a lot and the new display drivers in UD1 and SDLBasic are in conflict. The SDL display was so slow that it's was intolerable ; a lot of IO conflict with the mouse, so severe that I was constantly resetting the system from the tower reset! I think SDLBasic is out-of-date with OS upgrades huh?

That might have been caused by a bug in Prefs/ScreenMode, which uses the tooltype "INTERRUPTS=Yes" instead of the correct "INTERRUPT=Yes" (note the missing S). i.e. It accidentally disables video interrupts.
