Temporary freezes while reading partition

URL:

Hello,

my PegII has a sii3114 SATA interface, connected is a 640GB harddrive. Recently I discovered temporary system freezes while reading data from that hard disk (some partitions, mostly SFS2 formatted, the biggest one 480 GB).

After some seconds of no operation/total freeze the read process went on without an error and all user actions seemed to be buffered, so all my desperate clicks were processed.

An immediate call of Dumpdebugbuffer reports:

```
[sii3114ide/ata_rw_blocks] unit 1 lba28 read error 73, retries left : 4
```

What's going on here?
