Timberwolf and ??1 with OS4.1.2 problem

I downloaded the Timberwolf zip from OS4 depot and decided to give it a try today but alas, it won't work. I did the installation using the script that comes with it but after that and a reboot, whenever i click on the Timberwolf icon my ??1 just sits there doing nothing. I read that when run for the first time, Timberwolf might run with a slight delay. In fact i waited enough for it to run with no results whatsoever. Any ideas/suggestions are welcome. Anyone that had the same problem?
