Do you think it could be possible to implement a bit more native GUI already in this first Alpha version ?  
(expecially menus)

I don't think we'll add it to an alpha version, but it's something that I do want to implement. Firefox does support the use of custom menus (Mac versions need this). However, the menus need to conform to certain standards, like being able to show custom images and nesting depth. The former is possible with Amiga Menus, but I'm not sure about the latter (it's been ages since I've last written more complex intuition code).

In general, I want as much Amiga-specific features as possible.

Also how about the real speed ?

Ok you say a bit slow, yep currently i think it's quite normal for that HTML5 videos but how about "normal" navigation ?

See my other post, it's comparable with MUI OWB. I test it on the Pegasos, and with an optimized build, it's perfectly usable. I have not tried it on a Sam yet, I'll have to check. And I know someone who will surely test it on his BlizzardPPC :|
