I also curious about mediaplayer inbuild in the FF (that one, which handle html5 audio/video). Can it handle audio as well for now, or only video ? And if both, how fast is it ?

I assume it will be slow (because on work done on the mediaplayer itself, just porting over the plain ffmpeg libs or whatever). I.e. no overlay for fullscreenmodes and other fancy stuff which will make it works fast and good on even 600-800mhz ?

Btw, that "subclassing of menus" limits was already discussed some months ago here, in the QT thread, when Alfkil want to implemnt native amiga menus. And we all forces to "time to implement submenus into our intuition or whatever". But as stop-gap, Alfkil still add it , with just one notice "sorry, only 1 sub-level of menus is possible". And, by the way, almost all the apps are have 1 sub-level of menus. Not so offten 2 , but imho for such project as TW, those few menuses where is 2 levels, can be tweaked to just 2 menus per 1 sublevels, except one with 2.

And no images in menu also not so cool, but that definately something to implement in reaction (by Rigo ?:) )
